## Hamiltonian

$$H = \omega_r \left( a^\dagger a + \frac{1}{2} \right) + \omega_q \frac{\sigma^z}{2} + g \left( a^\dagger \sigma^- + a \sigma^+ \right)$$

- $\omega_r$ : cavity resonance frequency
- $\omega_q$ : qubit transition frequency
- $g$ : strength qubit-photon coupling

Circuit cQED

- Transformation:

$$U = \exp \left( \frac{g}{\Delta} \left( a \sigma^+ - a^\dagger \sigma^- \right) \right)$$

- Hamiltonian to first order in  $\frac{g}{\Delta}$ :

$$\begin{aligned} H_0 &= U H U^\dagger \\ &\simeq \omega_r \left( a^\dagger a + \frac{1}{2} \right) + \omega_q \frac{\sigma^z}{2} + \chi \left( a^\dagger a + \frac{1}{2} \right) \frac{\sigma^z}{2} \end{aligned}$$

where  $\chi = g/\Delta^2$

# Driving terms

Ming, Elena

Introduction

The model

Cavity QED

Driving terms

Measurement

Numerical  
simulation

Property of the  
cavity

Reproduce results

Discussion

Circuit cQED

- To conduct a measurement we first drive the cavity:

$$H_{\text{rf}} = \epsilon_{\text{rf}} \left( a^\dagger e^{-i\omega_{\text{rf}}t} + a e^{i\omega_{\text{rf}}t} \right)$$

with  $\omega_{\text{rf}}$  near  $\omega_r$

- The frequency shift of the qubit measured with a sweeping signal

$$H_s = \epsilon_s \left( a^\dagger e^{-i\omega_s t} + a e^{i\omega_s t} \right)$$

with  $\omega_s$  near  $\omega_q$

- Note that relative strength of  $\epsilon_s$  is not mentioned. We treat it as a perturbation.

515-518

Ming, Elena

Introduction

The model

Cavity QED

Driving terms

Measurement

Numerical  
simulation

Property of the  
cavity

Reproduce results

Discussion

Circuit cQED

- Applying the transformation

$$U = \exp \left[ \frac{g}{\Delta} (a\sigma^+ - a^\dagger\sigma^-) \right]$$

- And moving to the rotating frame:

$$U_I = \exp \left[ i \left( \omega_{\text{rf}} a^\dagger a + \omega_s \sigma^z / 2 \right) t \right]$$

$H_{\text{rf}}$  and  $H_s$  are:

$$H_{\text{rf}} = \epsilon_{\text{rf}} (a^\dagger + a)$$

$$H_s = \left( \frac{g}{\Delta} \right) \epsilon_s (\sigma^+ + \sigma^-)$$

# Final Hamiltonian and collapse operators

Nature 445,  
515-518

Ming, Elena

Introduction

The model

Cavity QED

Driving terms

Measurement

Numerical  
simulation

Property of the  
cavity

Reproduce results

Discussion

Circuit cQED

- Full Hamiltonian:

$$H = \omega_r \left( a^\dagger a + \frac{1}{2} \right) + \omega_q \frac{\sigma^z}{2} + \chi \left( a^\dagger a + \frac{1}{2} \right) \frac{\sigma^z}{2} \\ - \left( \omega_{rf} a^\dagger a + \omega_s \frac{\sigma^z}{2} \right) + \epsilon_{rf} (a^\dagger + a) + \epsilon_s \frac{g}{\Delta} (\sigma^+ + \sigma^-)$$

- Collapse operator:

- Collapse operators cavity:  $\sqrt{\kappa(1+n_{th})}a$ ,  $\sqrt{\kappa(n_{th})}a^\dagger$
- Collapse operator qubit:  $\sqrt{\gamma}\sigma^-$
- Dephasing:  $\sqrt{\gamma_\phi}\sigma^z$

# Measurement

Nature 445,  
515-518

Ming, Elena

Introduction

The model

Cavity QED

Driving terms

Measurement

Numerical  
simulation

Property of the  
cavity

Reproduce results

Discussion

Circuit cQED

In the experiment, the transmitted amplitude at frequency  $\omega_{\text{rf}}$  is the main observable. The exact way to measure can be found in Schuster's thesis [3]:

- What we really measure is the expectation of the voltage, or electrical field  $E \propto \langle a + a^\dagger \rangle$

# Property of the cavity: Analytical

Nature 445,  
515-518

Ming, Elena

Introduction

The model

Cavity QED

Driving terms

Measurement

Numerical  
simulation

Property of the  
cavity

Reproduce results

Discussion

Circuit cQED

- Without the qubit, the cavity state is equivalently a damped harmonic oscillator with driving

$$H = \delta a^\dagger a + \epsilon(a + a^\dagger)$$

Collapse operators:  $\sqrt{\kappa(n_{\text{th}} + 1)}a$  and  $\sqrt{\kappa n_{\text{th}}}a^\dagger$

- When it's off resonant, its steady state is not but approximately a coherent state
- Analytically the photon number expectation value is

$$\bar{n} = \frac{\epsilon^2}{\delta^2 + \kappa^2/4} + n_{\text{th}}$$

# Property of the cavity: Numerical

Nature 445,  
515-518

Ming, Elena

Introduction

The model

Cavity QED

Driving terms

Measurement

Numerical  
simulation

Property of the  
cavity

Reproduce results

Discussion

Circuit cQED

- Numerically, a truncate on Fock space is needed
- To check the validity of the truncate, we plot the photon distribution and frequency response of the cavity.

# Direct spectroscopic observation of quantized cavity photon number

Nature 445,  
515-518

Ming, Elena

Introduction

The model

Cavity QED

Driving terms

Measurement

Numerical  
simulation

Property of the  
cavity

Reproduce results

Discussion

Circuit cQED

For a fixed driving  $\epsilon_{\text{rf}}$ ,  
plot the reduction  
 $V_0 - \langle a^\dagger + a \rangle_{ss}$  v.s.  $\omega_s$ .

$\epsilon_{\text{rf}}$  is labeled by  $\bar{n}$  with  
relationship:

$$\bar{n} = n_{\text{th}} + \frac{\epsilon_{\text{rf}}^2}{\delta^2 + \kappa^2/4}$$

# Direct spectroscopic observation of quantized cavity photon number: compare

Ming, Elena

Introduction

The model

Cavity QED

Driving terms

Measurement

Numerical  
simulation

Property of the  
cavity

Reproduce results

Discussion

Circuit cQED

For small signal, there's a range where the transmitted amplitude is increased. We'll explain it later.

# Thermal Drive

Nature 445,  
515-518

Ming, Elena

Introduction

The model

Cavity QED

Driving terms

Measurement

Numerical  
simulation

Property of the  
cavity

Reproduce results

Discussion

Circuit cQED

- Thermal Drive is equivalent to setting  $n_{\text{th}}$  in collapse operator to the driving average, with small  $\epsilon_{\text{rf}}$  to show the phase lock-in at the given frequency.

# Thermal Drive: compare

Nature 445,  
515-518

Ming, Elena

Introduction

The model

Cavity QED

Driving terms

Measurement

Numerical  
simulation

Property of the  
cavity

Reproduce results

Discussion

Circuit cQED

- Note that there's no thermal drive theory fitting. Our results tracks fewer peaks, but this depends on how they do the measurement, which is not mentioned in the paper.
